Figure 2 shows the types of fuel used in the passenger car market in the UK for the years 2007 and 2017.

First, the use of petrol-driven cars fell sharply from 59% of the market in 2007 to 53% in 2017. In contrast, market shares for the other two types of fuel increased steadily. The market for diesel cars rose slightly from 40% to 42% by 2017. This was perhaps a small improvement compared to the increase in the market for cars using alternative fuels, which rose sharply from 1% to 5% of the market. None of the fuel types remained the same over the period in question.
