... to start with, we need to consider firstly what disease is. In other words, how can we identify what we mean by a disease? And secondly, why is disease so important, and how can we fight it? After that, I'll talk about the global context of disease, because the worldwide distribution of each particular disease differs, along with the effects. Part of this involves analyzing population groups – in other words, demographics. So, then I'll discuss some future predictions for the incidence of disease, and I'll finish by mentioning the different tools we can use to make these kinds of predictions.
